

This book is an appealing, concise, and factual account of the chemistry of the solar system. It includes basic facts about the chemical composition of the different bodies in the solar system, the major chemical processes involved in the formation of the Sun, planets, and small objects, and the chemical processes that determine their current chemical make-up. The book summarizes compositional data but focuses on the chemical processes and where relevant, it also emphasizes comparative planetology. There are numerous informative summary tables which illustrate the similarities (or differences) that help the reader to understand the processes described. Data is presented in graphical form which is useful for identifying common features of the major processes that determine the current chemical state of the planets. The book will interest general readers with a background in chemistry who will enjoy reading about the chemical diversity of the solar systems objects. It will serve as an introductory textbook for graduate classes in planetary sciences but will also be very popular with professional researchers in academia and government, college professors, and postgraduate fellows.

The Article V Amendatory Constitutional Convention: Keeping the Republic in the Twenty-First Century, Rassismus und Gewalt im Fu?ball: Zivilrechtliche Schutzpflichten von Bundesligavereinen (German Edition), Countering al Qaeda: An Appreciation of the Situation and Suggestions for Strategy, LOOKING FOR ANGELS: Saint Irenaeus Reflections on the Holy Spirit, Life in the Confederate Army, The Romans on the Riviera and the Rhone: a Sketch of the Conquest of Liguria and the Roman Province,
