Not illustrated. 1907 Excerpt: ...ar8e! nence-AT and Aj AF AF should be small. The conclusion seems to be that the sectional areas of the flange-plates should be made as small as convenient, and the use of plates of great sectional area should be avoided. The results of this investigation of girders of two shear-surfaces are not here directly applied to determine formulas for different cases of loading. Such formulas are readily obtained from the foregoing equations, but it is very doubtful whether they would serve any useful purpose. The formulas obtained for girders of single shear-surface afford probably as accurate an estimation of the distribution of stress as can be obtained by calculation in the manner set forth in this Paper. An approximation to the conditions of stress with two shear-surfaces may be in all cases obtained by using the foregoing value of s in place of y . Experimental Verification of the Distribution of Stress in Riveted Girders.--The deflection of a loaded riveted girder is governed by the distribution of stress in it; any sliding-action in the webflange connection which may occur would therefore affect the deflection-curve of the girder. In Appendix V the deflection-curve of a riveted girder is calculated for the case of a single load placed at any point in the span, and the deflection is compared with that which would be obtained if the flange-web connection were quite rigid. The measurement of the deflection-curve of a riveted girder therefore provides a method of experimentally verifying the distribution of stress in it. Practical Applications of the Results obtained in the Foregoing Investigations.--There is usually a considerable amount of uncertainty with regard to the application to practice of results obtained by lengthy and involved mathematical reaso...
