Porcupines (Nocturnal Animals) [Mary R. Dunn] on thepepesplace.com *FREE* shipping on qualifying offers. While others sleep, porcupines move about. These forest. Porcupines are rodents with a coat of sharp spines, or quills, that protect against predators. The term covers two families of animals, the Old World porcupines of family They are less strictly nocturnal than their Old World relatives, and generally smaller. In taxonomic terms, they form the family Erethizontidae. Out of all porcupine species, only one (Philippine Porcupine) is listed as vulnerable. That means that it can Porcupines are nocturnal animals. This means that. If the porcupine hits an animal with its quills, the quills become embedded in the animal. It is mostly nocturnal, but will sometimes forage for food in the day. There are more than two dozen porcupine species, and all boast a coat of needle -like quills to give predators a sharp reminder that this animal is no easy meal. Notes and images of North American porcupines, updated from the Canadian When a quill gets stuck in another animal's skin, the barbs make removing the quills painful Primarily nocturnal, North American porcupines are active all year .
